

M.A.P.O. Pipeline

Model-Agnostic Pipeline Orchestrator — 5-Stage Execution Flow

Stage Outputs

RETRIEVE → contextChunks, relevanceScore, latencyMs

PREPARE → tokensEstimated, adapterApplied, promptHash

EXECUTE → modelUsed, rawOutput, fallbackTriggered

SCORE → safetyScore (0-1), qualityScore (0-1), passedThreshold

Every AI request flows through all 5 stages. If SCORE fails threshold, EXECUTE is retried with fallback model.
